Investigate Net Partitioner (<http://www.solsoft.com/>).

They (disclaimer: ex-we) support PIX and a load of other devices. Define your network, tell NP that that device is a PIX, that one too, that one a router w/o filters, etc., define your policy, compile, upload filters.

Exercise left to reader : PIX catches fire, no replacement PIX, replace with other supported device, tell NP (10 seconds), recompile (20 seconds), reupload. Compare time necessary to rewrite PIX rules, even using sed, for something non-IOS.

Payware (probably lots of \$\$\$ for your config), but gratis time-limited demo.

HTH.
