Group:

I'm product hunting, and out of ideas.

I'm looking for two things, and hoping somebody can make some recommendations.

1. In a current design, wouldn't mind implementing an mail proxy – at least SMTP gateway/relay, although Pop3 would be welcome also. Don't really need some complex do it all box – just looking for a standalone type component to isolate this function and fit into the current architecture which does most other stuff well. Need COTS product, opensource not possible. Interscan VirusWall is about the only thing I can find – don't need the virus layer, but might go that direction anyhow.

2. Looking for a inbound traffic web proxy, or even an 'url scan' type product, for a Lotus Domino system. Currently externally hosted front-end web page redirects links to apps on an AS400 domino box, which is on the inside network, and gets traffic NAT'd and passed through the FW (this box is also the SMTP box). Looking to get around this and put a 'proxy' of some type on the DMZ. Not my ideal solution for this architecture, but additional AS400 or Domino box for external apps is out of the question in the current budget year. Proxy of some type will likely make it a little better. Again, need COTS, opensource not possible. Proxying domino is a big unknown – anybody seen/done this, or have recommendations?

Thanks,

Jeff B.
