You could use an IDS such as snort to detect traffic from kazaa or other p2p software. This would alert you that people are using the software but wouldn't actively prevent it.

If you script well, you could have snort monitor just p2p traffic and pipe the output to a script that automatically adds rules to block IP addresses that your user's p2p software connects to. Make sure the snort box connects via ssh and that it does not accept incoming connections at all.

Btw, Port 80 is used as a backup port number for kazaa.
