So, like Anthony Schneider was saying to me just the other day:

- > *Type `ls -lo /path/to/ypchfn`, and look for flags set on it*
- > *(i.e. `schg`, `uchg`). If any of these are set, you will*
- > *need to run*
- > *`chflags noschg ypchfn`*
- > *(or switch `noschg` with whatever flag is set).*
- > *Not sure what else it might be.*
- > *-Anthony.*
- >

So cleverly, I did this and it didn't work.

Then I got to thinking...

```
# sysctl kern.securelevel
kern.securelevel: 1
```

Uh oh. Hack `rc.conf`, back down to `-1`...

```
# chflags noschg ypchfn
```

And finally.

```
# chmod -x ypchfn
```

Woo hoo!

OK, so I feel a bit better now... :-)

Thanks!

jdl
