Awhile back, I managed to reproduce this by portscanning myself with a very fast scanner which doesn't wait for any kind of response from the server before testing the next port. The 1800 to 200 message thing sounds quite general, so you could be getting flooded with lots of different kinds of data. If the messages come in briefly and then stop for awhile (rather than a continuous flow) you could just be getting a fast port scan.
