question on this?

maybe i am more disillusioned than i thought but if i patch and update how can i be as vulnerable as on windows?

i run a program called killerwall as my firewall

it is a script that uses ipchains or iptables .i chose iptables because of my reading and thinking this was safer.

i dont understand how rootkits work tho and my reading has not helped my understanding of this very much.

i dont do downloads except with acceptable ftp sites .no music/movies stuff.in fact my only downloads have have been with urpmi?

can rootkits be used this way?

apologizing for my ignorance ahead of time but i am hoping to learn
br3n

> *That's true. I just want to remember about the guy with the rootkit*

> *which I asked about. Running SuSE Linux, patching regularly and thought*

> *he was safe while running an unpatched PHPNuke installation. Ouch. :-)*
