This happens sometimes. The (MSI3) installer doesn't clean up the temporary folder. The syntax is something similar:

```
msxml4-KB927978-enu /q REBOOT=ReallySuppress /! *v c:\KB927978.log
```

Where the last part is the path to the log file

Yes, there seems to have been some debris left from this one. (Based on a look at 5 systems)

No errors to speak of.

Dave "No, not that one" Korn wrote:

Last tuesday's updates (which I deferred installing until yesterday)

left

a folder on my HD, called "C:\c0772dab3463959f7c", containing a log

file,

msxml6-KB927977-enu-x86.log, which contains install logging details

for the

msxml patch.

My folder is named c:\6ad0c137abd5117c8e8326 , and my file is named  
msxml4-KB927978-enu.log

Did everyone get this (or perhaps a similarly-named folder with a  
different hex number)? If absolutely everyone ended up with this it's  
probably just M\$ being careless, but if not it might mean something

failed

during install and that's why it didn't clean up properly.

I just checked 2 random machines at the office, and they both have  
similar directories with the same log file. My assumption would be that  
it's just sloppy installation leaving files rolling around...
