Since it hasn't shown up on NTBugTraq yet...

http://www.nextgenss.com/advisories/snmp_dos.txt

"If the SNMP service is running on a Windows 2000 server, and the 'Print Spooler' service is not running, repeatedly using SNMP queries to obtain print queue related values in the LANMAN MIB will cause the SNMP service to consume very large amounts of memory." [Chris Anley, NGSS]

Microsoft's Q:

<http://support.microsoft.com/default.aspx?scid=kb:en-us:Q296815>

Quick fix: Replace lmmib2.dll with SP3's version until you can schedule a reboot to apply the entire SP3. Note this will cause complaints in Windows File Protection.
