>*Unchecked Buffer In Windows Component Could Cause Server Compromise*
(815021)

Thanks for the tip off Russ but now I have a question. Prior to this I had a system to apply patches in the order they were released, this led to a good secure setup where no patch was backdating some component of another patch.

This was the order I was using to secure a web server:

NT4
SP6
SRPi.exe
Q301625
Q305399
Q319733
Q321599
Q312895
Q326830
Q323172
fpse0901.exe
Q323255
Q327969
Q329414
Q329115
Q810833 1/23/03
js56men.exe 3/19/03
Q811493 4/29/03
Q813489 4/29/03
Q811114 5/28/03

Ok, so now that they have released an NT4 patch for 815021, where in this order do I install it so it doesn't backdate anything? It was originally released on 3/17/03 which would put it right after Q810833 HOWEVER the release date for the NT4 version shows as 4/23/03 originally so that would put it after js56men but then the updated NT4 with verification keys shows
