Hi Russ:

If you check microsoft.public.xml and search for "access denied" you will see a number of users have experienced the same problem I'm writing about, starting soon after MSOFT first released MSXML4 sp2 a few weeks ago.

The problem is:

After upgrading to MSXML parser 4.0 sp2 on Win2k sp3+, there's a permissions error generated when the MSXML4 dll is called in a POST operation on a webpage.

Error Type:  
msxml4.dll (0x80070005)  
Access is denied.

when calling:

```
xmlServerHttp.open "POST", upsServer, false // POST is the problem
xmlServerhttp.setRequestHeader "Content-Type",
"application/x-www-form-urlencoded"
xmlServerHttp.send data // generates the error
```

I don't know if MSOFT is aware of the problem or not but it's infuriating because there's no way to roll-back to a recent version since MSOFT only has the latest sp2 on it's site. You can remove XML 4 and reinstall to XML3 sp2.

Sorry I'm not much of a programmer or I'd try to give you more info!
