BSD–AirTools, WEP Related Tools

DETAILS

<<http://www.dachb0den.com/projects/bsd-airtools.html>> BSD–AirTools is a package that provides a complete toolset for wireless 802.11b auditing. Namely, it currently contains a BSD–based WEP cracking application, called dweputils (as well as kernel patches for NetBSD, OpenBSD, and FreeBSD). It also contains a curses based ap detection application similar to netstumbler (dstumbler) that can be used to detect wireless access points and connected nodes, view signal to noise graphs, and interactively scroll through scanned ap's and view statistics for each. It also includes a couple other tools to provide a complete toolset for making use of all 14 of the prism2 debug modes as well as do basic analysis of the hardware–based link–layer protocols provided by prism2's monitor debug mode.

BSD–AirTools currently consists of quite a few different tools; they have individual informational pages that can be viewed below:

- * dstumbler v1.0
- * dweputils v0.1
- * prism2ctl v0.1
- * prism2dump v0.01
- * bsd source–mods v0.2
