Novell Netware Client Unchecked Buffers

SUMMARY

Multiple Buffer Overflow Conditions Exist in the Novell Netware Client for Windows. An attacker could crash any software relying on name resolution, like ping, traceroute, rexec and rsh.

DETAILS

Vulnerable systems:

- * Novell Netware Client 4.83

If one would run the command ping with a long hostname an access violation would occur. Depending on the length of the hostname the program will crash in different locations. This might be interesting in a WTS or Citrix environment. We have looked very briefly at the problem and therefore cannot comment on the impact of this issue.

Solution:

Install patch from Novell as soon as it becomes available.

Vendor status:

Novell was contacted 20020412.
