When was the last time you checked your server's security?

How about a monthly report?

<http://www.AutomatedScanning.com> -- Know that you're safe.

RPCAP, Remote Packet Capture System

DETAILS

RPCAP is a Remote Packet Capture system. It enables you to run a packet capture program (the server) on a target computer, which will sniff the network traffic on that system, and uplink the captured packets to another host (the client), where the captured packets can be processed, analyzed and archived. The rpcap system thus consists of two separate processes, the server (or agent) which captures network traffic on a remote system, and a client, which receives and processes these packets. The server code is a standalone executable program which uses the libpcap packet capture library to capture network traffic. The client is a library called librpcap, which is linked to a user program and used on the client system in a manner identical to libpcap, to receive and process the captured packets.

ADDITIONAL INFORMATION

The tool can be downloaded from:

<<http://rpcap.sourceforge.net/>> <http://rpcap.sourceforge.net/>
