Hotspotter – a Wireless Honeygot

SUMMARY

DETAILS

Hotspotter passively monitors the network for probe request frames to identify the preferred networks of Windows XP clients, and will compare it to a supplied list of common hotspot network names. If the probed network name matches a common hotspot name, Hotspotter will act as an access point to allow the client to authenticate and associate. Once associated, Hotspotter can be configured to run a command, possibly a script to kick off a DHCP daemon and other scanning against the new victim.

ADDITIONAL INFORMATION

The information has been provided by Max Moser, Joshua Wright.
