Hash: SHA1

This is for immediate release. This may not be sent to any "advanced warning system", such as ARIS. This was written for the community, and not just a few companies with deep pockets full of the big dollar.

Attached is a remote Apache 1.3.X exploit for the "chunking" vulnerability. This version of the exploit works only on OpenBSD. "Experts" have argued as to why this is not exploitable on x86/*nix. This version of the exploit has been modified to convince these "experts" that they are wrong. Further, it is very ./friendly and all scriptkids/penetration testers should be able to run it without any trouble.

My God have mercy on our souls.
