For some reason files were corrupted during the upload process. Now the correct archive is in place, together with a md5 sum of it.

Apologies for the 'noise'.

Hi List,

FG-Injector is a free tool that leverages the pentester's work by facilitating the exploitation of SQL Injection vulnerabilities.

It includes a powerful proxy feature for intercepting and modifying HTTP requests, a network spy module to allow the analyst view HTTP requests and their corresponding responses and an inference engine for automating SQL injection exploitation.

The Inference Engine Module of the FG-Injector Framework automates the generation and injection of SQL statements needed for exploitation of a Blind SQL Injection. This module will work also for regular injections using the same method. It can produce blind injections on web/app servers using MS SQL Server, MySQL, and PostgresSql DBMSs.

Get both, sources and a windows binary from:
