Hi Michael,

U mean Intrusion detection System , if I am not wrong , U might want to look at some of the solution available in the market which allows u to manage the IDS/IPS sensors installed at the remote locations from the centralised yet distributed management system. Also look for strong management features like delegation of administrator duties with appropriate rights.

You can look at the products like Fortinet, iPolicy IPF, juniper ISG, and Tipping point. All are comparable strong IDS/IPS solution.

Best of Luck !!

TCP-FIN

Hi all,

I've been using in-place scanners such as snort in the past, but now we want to roll out clients to our user computers and servers in remote offices, to inspect traffic and generate real-time alerts.

Are there any client solutions that will do this? I am the only Linux guy on staff, so a Linux-heavy solution won't sit well with the other IT folks here.

Thanks

Mike
