Hello, all.

I have operated redhat linux 7.x whcih kernel is 2.4.26.
When I run tcpdump or snort, the dmesg is seen like below.

"device eth0 entered promiscuous mode"

and when I stop tcpdump or snort, the dmesg is seen like below.

"device eth0 left promiscuous mode"

But I can't find PROMISC message when I execute ifconfig while tcpdump or snort.

Why the result of the dmesg and ifconfig is different?

Thanks in advance.
