If you are considering MAC (Mandatory Access Control) features, have a look also at RSBAC (<http://www.rsbac.org/>), it is a quite complete modular MAC system [_personally_ I find it much better than Selinux, with many more features and depending on your skills on setting it up, it can give you a much higher security]. You can find also Fedora Core rpms at

<http://fedora.rsbac.mprivacy-update.de/>

FC-4 rpms should be out in a couple of weeks, in the meantime you can use FC-3 rpms which have been reported to work fine also on FC-4.

Please notice that there is little support on these rpms, they are just given as a help to test and start you off with RSBAC. If you plan to use RSBAC in production environment, use the official distribution (and patch and compile the kernel etc.etc.). Best,

Andrea

PS. Workstation rpms for FC4 are under development, they do not offer MAC features, but they give antivirus scanning on access (clamd-clamuko/dazuko), anti buffer overflow (PaX) and resource exhaustion control.
