Hi Rick,

Yes I am using the security config and analysis snap-in to create the template. I still can't figure out why all of the security settings that I define in the local computer policy's administrative templates aren't included in my exported template.

Right now the only way that I know how to get those settings applied to my windows servers is to track every registry entry that I change through those administrative templates. Then I can either modify the registry directly through a batch file or maybe add them to the security configuration editor (as described in MS KB article Q214752), and then create the template.

This whole approach seems like way too much work. Anybody have better ideas for me?

Thanks,

CB

C.B.

Are you sure you're exporting a security template using the Security Configuration and Analysis snap-in?

I thought the Security Template snap-in was used to create or edit the templates. The SCA or secedit.exe was used to apply the template to a specific machine.

Hi C.B.

Could it be that a default policy on the target computer (the one you are applying the exported policy) is over writing your imported changes.

Kind Regards
Gill

Subject: local security policy

Hi all,

I'm trying automate the configuration of security settings on new w2k server installs. The servers will all be standalone servers. Part of my plan is to have settings defined in the local security policy be applied from a script.

I can export local security policy settings by using the security configuration and analysis snap-in. Then I can use secedit to apply that exported template to new servers in post-installation scripts.

The problem I'm having is that I don't know why any changes made in the "administrative templates" don't seem to be included in the exported template. When I apply this template to the new server all of those settings are "not defined"

Are those security settings exported/saved/applied a different way than the rest of the local security policy settings?

Any help would be appreciated.

Thanks,
CB
