Hi gerson

What i observed in my environment when i tried to applied GPO...i had the same kinda problems. but in my case i had already run IEAK on some machines and these machines were not applying any gpos. after when itried on new installations of IE6..the gpo went very smoothly.

In your cases, may be try to see whether u have default domain policy in place. sometimes ur policy will be applied followed by which some other policy like default domain policy will override ur policy settings..worth to have a look at them

regards

Subject: FW: I'm falling my hairs with this domain gpo problem

Where is the GPO linked?

Is it at the domain or a specific OU?

Do Authenticated users and Domain Computers have permissions to "Apply GPO" in the GPO?

More info would be helpful helping you....

Hope this helps.

Alberto Mujica

RE: I'm falling my hairs with this domain gpo problem

SecurityFocus Microsoft: RE: I'm falling my hairs with this domain gpo problem

Hi all,

I'm having problem with a domain policy. It doesn't arriving at w2k workstations.

configuration: 2 DC's W2K Server for Domain1 and 2 DC's W2K Server for Domain2, both with sp3.

I deployed a domain policy (account policies for computer and adm templates

for user). I have tested domain1 policy in several ways and all seemed well.

After one week, I did the same for the 2nd domain, but it was unsuccessful.

I didn't understand. I checked domain1 and it unhealthy too. The gpresult log

indicated that the domain gpo had been applied, but it wasn't true. I changed domain gpo, but nothing happened. All alternatives failed.

Then I decided to restart the servers. After this, I saw gpresult log and

only local security policy was explicitly applied. After restart the servers, only local security policy was showed in the gpresult log (for both

domains). Account policy, age, complexity password are on and ok. Computer

domain policy is going well even nothing more than local policy is showed

into gpresult log.

What I tried?

1. Replmon: ok for all DC's
2. Gpoutil: ok for all policies.
3. Several unsuccessful combinations, disabling the current domain policy and creating new ones.
4. Two new different user accounts on four different network computers for each domain.
5. I changed computers name. I removed them from domain and added them again. Failed too.
6. All event logs are cleaning. No problems related...

When domain1 gpo has been deployed I remember W2K Prof were SP1. Domain2 gpo

was deployed after w2k computers have been elevated to sp3. I don't know whether it's a problem or not.

Any help will be appreciated.

Thanks

Gerson
