I think you will have a tough time blocking such applications. They will search for ports not being blocked in order to make connections such as 110, 21, and 80. I am not familiar with ISA server but the only way I know of to block them is at the application layer.

Good Luck,

Duston Sickler

There are only 10 types of people in the world, those who understand binary and those who don't.

Subject: p2p and ISA

Greetings everyone,

My apologies if this is not the correct forum for this posting. I work for

a small shop running MS ISA. Has anyone successfully blocked inbound &

outbound p2p file sharing (Kazaa, Morpheus, etc) using ISA? It's not

enough to configure rules blocking port 1214 in and out as I've been

reading in other forums. I would appreciate any suggestions any of you may

have for how to do this either through the list or via offlist reply.

Thanks in advance.
