Not really sure what to tell you on this. There's only 2 reasons why it wouldn't be showing up as far as I know:

- 1) the machine is not joined to the domain
- 2) the options button has been pushed and hides domain drop-down & dial-up connection checkbox

I've done very little RRAS stuff so I wouldn't be able to elaborate on that. Hope this helps!

Thanks,
Ryan Gravlin

Subject: RE: Integrating Domain and VPN Login

Is there any reason that check box would not be available on these machines?

They were previously at the same location as the domain controller and were joined to the domain at that time.

This can be accomplished through the check box that says 'Logon using a dial-up connection' at the logon screen. This can also include a VPN profile.

There are other ways of accomplishing this too. CheckPoint's SecuRemote

RE: Integrating Domain and VPN Login

SecurityFocus Microsoft: RE: Integrating Domain and VPN Login

has a secure domain logon feature, which basically halts the process of authenticating with the domain controller until it has established a VPN connection with the site. It shoots the authentication over the encrypted tunnel and continues to login using the lmhosts and hosts file for static mappings.

I hope that helps.

Subject: Integrating Domain and VPN Login

I'm trying to find a way to integrate a login to a VPN with a domain login.

Users at a remote office currently login using a cached profile then manually start a VPN connection using the client included with XP Pro. These machines are then authenticating to the Windows 2000 server at the central office. I know in NT4 there was a check box for dial up authentication to a domain, however is there anything similar to this for XP to allow seamless integration of these two logins? I tried setting the VPN to login using the Windows credentials and putting a shortcut in the startup folder, however the VPN connection does not start that way for some reason.

Ryan
