First I would like to thank everyone for their responses and I'm going to answer some of the things that seemed to come up in a lot of the suggestions.

First off, the server is running NFS but it is sharing mounts to another server. I do not having anything mounted from the other server, nothing in automount.

I have tried stopping NFS just to see if that is the issue, no luck.

I've run FSCK – nothing major there, but didn't fix it either.

I'm running NIS, but this machine is the NIS server, so it isn't looking up anything on the other server. And a look at the nsswitch.conf file looks good.

I've tried other users, same result.

Restarted nsd.

Now when I used `truss -f ls -l` this is what I found was hanging.

```
2970: lstat64("./vol", 0xFFBEF9D0) (sleeping...)
```

```
2970: lstat64("./vol", 0xFFBEF9D0) Err#4 EINTR
```

So that is where I'm at at the moment.

I also have run chkrootkit and it found no problems with ls.

Thanks,

Michael
