Your input isn't going to a database server, it's being used in a vbscript statement in the .asp script. The VBScript code is probably doing some sort of calculation and freaked out when it tried to do it with non-numeric data. So SQL injection probably won't be possible with that parameter. If they're not sanitizing input on that script though, they're probably not doing a great job in other places either. Keep on trying other parts of the web application.

Kevin.
