Hello to all...

I have a question that I hope will not be vague enough to just solicit links. I am currently involved in a test that involves the deployment of a product made by BMC called Control-SA as the front-end authentication mechanism. I understand how the user profiles and a users priviledges are tasked in a central repository, but was more interested in how it performs the updates! Does anyone have experience or know of its caveats or weaknesses.

Many thanks  
Johnny Blade
