Hi!

You have two other tools that can scan for web vulnerabilities:

- babelweb <http://www.hsc.fr/ressources/outils/babelweb/>
- whiskern <http://sourceforge.net/projects/whisker/>

For some accurate vuln. scans, you can try cgiscan.s, phfscan.c, ..., so some more specific tools.

Your network Firewall and IDS products do not prevent Web application
exploits – the most common form of online attack – resulting in Web
defacement, data theft, sabotage and fraud.

KaVaDo is the first and only company that provides a complete and an
integrated suite of Web application security products, allowing you to
assess your entire environment, automatically set positive security
policies and maintain it without compromising business performance.

For more information on KaVaDo and to download a FREE white paper on Web
applications – security policy automation, please visit:
