('binary' encoding is not supported, stored as-is)

An using Sandstorm Phonesweep v4.4 in the UK, and using two USR Courier-I external modem/TA units for connection via ISDN Basic-Rate lines.

I am getting variable results when testing the same target lines. When set to 'penetrate', the software sometimes does not bother to try my username/password list. Also, as I use the 'dont use single call detect' feature, I find that repeating calls often do not sync up properly and the modems hang.

Does anyone have this software, and use the same modem/TA units in the UK?? If so I would like to know all the AT and S-Register settings for the Courier-I units.

Any information gratefully received.
