Hi All,

I have been asked to perform web application security audit and perform intrusion analysis/forensics tasks. I am not an expert in the forensics field (I am very comfortable on a Linux system though) so any pointers would be appreciated.

Main question however is, what would one charge (in AU\$ if possible) for a webapplication security audit. If replying on here makes anyone uncomfortable feel free to email me directly. However I do need to know the figure asap. Also, should the client be charged if no vulnerabilities are detected.

Application in question: can't really give a lot of details on here but it would be something similar in size and complexity to an open source CMS product: Mambo.

Any help would be appreciated.

Thanks,  
Serg

Audit your website security with Acunetix Web Vulnerability Scanner:

Hackers are concentrating their efforts on attacking applications on your website. Up to 75% of cyber attacks are launched on shopping carts, forms, login pages, dynamic content etc. Firewalls, SSL and locked-down servers are futile against web application hacking. Check your website for vulnerabilities to SQL injection, Cross site scripting and other web attacks before hackers do! Download Trial at:
