I'm doing it with python scripts, as a small project to help me learn python as well as learn more about nmap.

I downloaded 2 modules – pmap and MySQLdb – and wrote a script that uses the former to run scans and parse the XML output and the latter to append the parsed output to MySQL tables. I also downloaded the python API for GeoIP, a database of geographic data related to IP addresses, so I can log the location of each of the IP addresses I ping or scan.

You might check Fyodor's site for similar ideas...I think I saw similar scripts in Perl and PHP.

Cheers,

JC

Hello All,

I'm looking to see if anyone is currently dumping nmap scans to mysql and how they may be doing it. I see that there's a sourceforge page for a patch to the nmap code, but it looks to only support 3.x and not the latest 4.x code.

Also curious if anyone has a integrated this into a front-end of some sort.

Thanks!
