Sorry for the commercial plug

[Erin: if this should not pass to the list, just drop the message off the moderator's queue and let me know so I don't send similar things in the future]

CORE IMPACT has a Python module (uses win32api) to do just that, it is called "Record audio file" (there is also a "play audio file" and a "grab 1 frame from Webcam")

Basically, it uses the Windows MCI interface:

http://msdn.microsoft.com/library/default.asp?url=/library/en-us/multimed/htm/win32_about_mci.asp
http://msdn.microsoft.com/library/default.asp?url=/library/en-us/multimed/htm/win32_mci_reference.asp

There is also a generic "Execute MCI string" that we commonly use to amuse ourselves by opening/closing the CD door remotely once we've gain access to a target system running windows.

It should not be difficult to write your own quickly with Python and the above reference from the MSDN

Hi all,

I have recently entered with my boss to our corp. conference room to discover a new (shining) internet laptop on a side desk in the room.

During our chat I mentioned that the laptop has a builtin microphone and therefore enables covert eavsdropping in case the laptop is "ruled" from remote position, and therefore, a conference room PC should have no builtin mic.

My sceptic boss replied instantly - "I challange you, bring me a recording of

Re: Covert Microphone Application

any meeting – I'll replace the laptop, and you'll receive it."

I therefore need a small covert application (no need in process hiding), which will record microphone input to file. command line application is perfect.

Do any of you know any ?

Guys, I gotta have this laptop...

Regards,
Shiri

But, with all the advice and suggestions; did he get the shiny laptop?!

Thanks,

Ron DuFresne
