Good morning all,

I was wondering whether of you are using the Webscarab as a proxy tool to track traffic between your test sites and the server.

I have a site that requires multiple ip address connections for different segments of the site, and currently have a Automatic Configuration Script used in IE to redirect the site accordingly. However, I would need to track the server request and response with Webscarab.

Does anyone have any idea how I could go about this to set the proxy in webscarb?

Best regards,  
Paul Justin
