Hi,

I am doing a benchmark of IIS Vs Apache using QALoad.

I have following question for u all –

- 1) How many concurrent users and apache 2.0.59 for windows support with the default configuration?
- 2) What are the parameters I can tweak to support maximum concurrent users on single apache (2.0.59 for windows) box?
- 3) How many concurrent user I can support on IIS 6 with default settings?
- 4) What are the parameters to tweak IIS configuration to support maximum concurrent users.

Note – I am doing a benchmark considering that I am hitting a static page.

Appreciate for any reference / pointer.

Thanks in advance
