Why don't u check Checkpoint's Secure remote / Secure client ?
Just more \$\$ to your current lic and you're set.
With Secure client you have "Secure domain logon"

Kill me, donno what Linux & SSH has to do here ..

Cheers

T

Subject: VPN : window client connecting through Linux router to NT-Domain

Hi,

I'm looking for a solution on how to setup our corporate VPN.

For now, we have a Windows NT4-Domain secured by Checkpoint Firewall-1 running on NT4 server.

For some employees we'd like to setup a VPN. All employees use either NT4 Workstation or Windows 98. Then they connect to the VPN they should act as a domain-member.

SecurityFocus BASICS: RE: VPN : window client connecting through

On the firewall I was thinking about forwarding one port to a Linux NAT box that accepts SSH-connections (so all connections are secured by SSH).

As an experiment we've tried connection from our LAN over SSH to another (external) Linux box by using the ppp-daemon. This gave no problem at all.

Problem is that we would like to have the possibility to initiate a connection from the outside to the Linux NAT server and the connecting side should only be running NT4 WS or Win98. Anybody who's got some clues where I can look for possible solutions?

Regards,

Koen
