As I said in my last post, technically NT does have it but, it's not automatic. That **only** works when people login and are running the login script. The only way that's effective is if users are forced to log off at a regular interval. The utility I refer to (timesync) in the 4.0 Resource Kit runs as a service and updates the time an assigned interval. I think the default is 8 hours but, it's configurable. I work in an environment that forcing users to log off is difficult at best. We found deploying this on our workstations and servers to be much more effective.

How do you keep your servers time's synchronized?

Been using this for years.

rem set time on machine

rem

@echo off

net time <server> /set /yes

rem share out folders

rem

net use x: \\<server>\<share>

RE: Sharing Folders

SecurityFocus BASICS: RE: Sharing Folders

rem end sample bat file

As for them sharing out folders. They can share any folder they create.

Hope that clarifies what I meant.
