The [incidents@securityfocus.com](mailto:incidents@securityfocus.com) owner rejected this post so can anyone here make sense of this?

On my 10.1.2.0/24 network, I discovered (with Ethereal) that one of my hosts (10.1.2.112) was broadcasting UDP packets to 255.255.255.255 to port 62516.

The \*source port\* though was incrementing by one after every packet. That host machine is running Windows 2000.

Anyone know what kind of activity this is? It seems the opposite of a port scan and it is inside my private network. I know which machine it is, I just can't figure out what it was doing so I disconnected it from the network until I figure it out.

Thanks,

AH
