I don't know if that's possible. You can map one drive letter in the user's profile tab using the Home Folder properties. You can also redirect certain folders such as My Documents and their desktop. I know of no way of mapping network drives without using a logon script.

You could possibly login as the local administrator, map the drives manually and then copy NTUSER.DAT to the Default User folder. You would have to remove the NTUSER.DAT from every user account (on every machine). I think this would only be useful if you were using images on a new set of boxes.

Why do you have an aversion to logon scripts?

Mike Fetherston
