Remember, we're talking about Windows Platforms 95,98 and ME and my book was written for basic home computer users only. It's has since grown into a book which will help three levels of computer Windows users. BTW- Crackers won't ever receive my respect and this is why "I" call them hackers.

The following is from a reviewer with the nick name of "Daniel"

*>Phone calls were made to these Internet Service Providers and their >representatives informed me that it's impossible to remove the 10-20 free >hours provided with Cable/DSL dial-up accounts. A major company should >have the capability to shut this avenue down on closure of any account.*

This is incorrect most major ISPs simply restrict access to their news servers by IP. Wrong IP no news. For the companies out there that use authentication the account terminates when they terminate your account. This is handled by back end software that the user never sees.

ME: We aren't talking about News Servers here (at the moment), only Cable and DSL companies I've had which didn't shut down/close the dial-up access they provided with these accounts. See my other Reviews 1-4.

ME: Earthlink News Server - I was able to use it after my account was closed. I don't remember the e-mail addresses used at the time, but I posted on alt.pets.ferrets with AT&T being my main host and Earthlink on the back end.

*>>> I was able to dial into my canceled Cable/DSL ISP*

Exclusive forms of connection. Unless she is saying the ISP in question had dial in back ups for if the service went down. In that instance it is sloppy administration nothing more.

ME: Read Review 1-4. The only new item I can try to address is my willingness to e-mail you my copy of Zone Alarm which hosted the Redwood Broker Backdoor which loads an SQL Server and it will pop up a Window Dial-Up Server showing the three canceled accounts I had, months after these Internet Service Provider accounts were closed down. The computer has to be online for this to be revealed. In my book, I suggested no one try this out because it's against the law, but I control no one. All I did was install a copy of Zone Alarm on a system running Windows XP, put the computer on the Internet and I ran netstat -a over a 3 minute period. God gave me the gifts from then on there. Windows services weren't disabled when the computer was put online.

> C. All Cable/DSL customers both business and  
>non-business, with dial-up access are vulnerable to a  
>number of hackers using this free dial->up avenue.

Wrong MOST Cable ISPs restrict access to mail and news by IP.

ME: We aren't talking about Mail and News Services, just dial-up accounts for Cable and DSL users when their account is canceled. See other Reviews.

>This is a loss of \$24 a month x's 50,000 = \$1.2 million a month, x's this >by 12 months = \$14.4 million a year loss in company revenue which could >be in your pocket. Estimated the above by the amount of attacks our >compromised computers were receiving on a daily, weekly and monthly >basis.

Meaningless most people the author identifies as "Hackers" would go nutz on dial up. There are more effective means of concealing ones identity online and not having to suffer at dial up speeds

ME: In my possession are many hard drives from victims who only used a dial-up connection and hackers do prefer to use dial-up over Cable and DSL. My only guess would be because the dial-up IP address changes often and this would be harder for anyone to track down the hacker. I'm not going to fight you nor anyone else on this issue, deal with it.

A PROPERLY compromised proxy or one that is configured for privacy will keep all but law enforcement out of the loop. Further there are enough free sources on the Internet for mail and news that I don't think the quoted prices are accurate. For example mail and news services can be had for 5\$ to 7\$ per month. Adjust figures and re-compute. Now factor in a little effort on the part of the person seeking the services and the cost are 0. Adjust figures and re-compute.

ME: Hackers set-up and configure Proxy Servers, Mail and News Servers on victims computers all the time. Am sorry that you don't understand this and it's your choice to be blind. I've shut down a few Websites which were listing innocent victims Proxy Server IP addresses and this babe is damn proud of my accomplishments. The victims haven't set-up any logs so it would be impossible to track any of the hackers who are abusing the above mentioned; period. Also, consider a hacker who will chain or bounce let's say, 50 innocent victims Proxy Servers and they change their computers date and time for each connection to them; what do you have and how can anyone track them down.

The Best Kept Secrets of Backdoors, Cracking, Firewalls, Hacking, Proxies, The Internet, Trojan Horses, Virtual Private Networks, Virus, Windows and different types of Servers can be found at:  
<http://geocities.com/secure2003flop>

BTW- I've added my Certificate of Registration number from the United States Copyright Office to my Website. Verification of my E-Book can now be verified for all to see.
