Interesting...I tried this and a couple other experiments and found some interesting results:

- 1) Double-clicking on the file on the desktop (instead of opening it inside of Word) does cause the pop-up box asking what program to use to open the file.
- 2) Tried to open a shortcut on the desktop (from inside Word) to WinZip and what appeared looks like a 208 page document of code (not very readable, just a lot of gobbledygook like "fÄj\$høFLV<u Vjèð").
- 3) Tried to open an actual program executable (an EXE file) and once again saw a bunch of code.

Apparently Word tries to open each and every file regardless of the type (tested this with Word 2000 on Win2000 system).
