TCP/UDP port 67 & 68 are used BootP/BootPS hich is the older way of obtainuing an IP address which was replaced with DHCP.

Ehm... this **is** DHCP.

I know that it is ;-)

The question where does it come from?

I only see the Wireless Networks (about 7 Routers and 2 Laptops seen), but it seems strange to me, that i see an IP in my denied Log ...

My LAN IP starts with 192.168
Provider IP with 80.109 ...

So i am wondering from where the IP is ...
Wireless or Provider?
Tracert/ping are not possible

Thats why i thought maybe security thing ;-)

If you want to increase wireless security, make sure that the Router will only assign addresses to provided MAC addresses.

The increase in security is **zero**.

WPE 128 + Mac only assigned is set ;-)

Is it still possible to come a network, if both are set?

.
