I'd like to be able to grant ONE user the privileges to change settings for certain programs on the local machine.

I have a laptop that is part of a domain.

I have a wireless card (orinoco). Everything works just fine.

To change the IP address, I have to log in to the domain as an administrator and change the IP. To change the wireless profile (on the orinoco configuration software), I also have to do this as Administrator.

I'd like to give a/one user the rights/privileges to change the IP address or to change the wireless profile while the user is logged in as himself.

What setting must be changed in the local or global policy setting and how?

thanks  
seth
