esteemed peers

i have an intel pocket digital pc web camera and it works just great with XP. however when i use it behind a hardware personal firewall (SMC), i can no longer video conference. it doesnt seem to matter which video conferencing software i use ==> Intel Video Phone, Microsoft NetMeeting, or Windows Messenger. none will allow me to connect to the desitination machine.

is there a range of ports associated with each application that need to be excluded from firewall protection in order for the video conferencing applications to function correctly? how can i enable the video packets to pass thru the firewall?

yours in technical need,
namin@nyc.rr.com
