Was wondering if some one might help out a novice. I am new to networks and am trying to learn. I have a developer background, so computers are not completely foreign to me. I have setup WinRoute 4.1 as our firewall, yet I cannot seem to get the local computers to gain outside access to the internet. I read that you have to use Windows 2000 DNS server if you have WinRoute setup on a Domain Controller with ADS installed. However, I am unable to get the whole setup working properly.

All other aspects of the setup are working properly, the DHCP is serving up correct IP addresses and such, but the internal machines are unable to access the DNS server and have requests forwarded through that server. The problem does not lie in the network connection as I am running the DNS server and WinRoute on the same machine. I am sure it is something that I am setting up incorrectly in my ignorance on the entire subject. Any help is appreciated.
