Harry,

I use WebWasher(great proxy) also, but with Opera 6.05(the ad supported version so far) for my browser of choice. On install, it will copy over your Favorites from IE as well as the proxy settings. It is easy in Opera for you to bypass the proxy, as well as enable/disable Java, JavaScript and pop ups on the fly by simply clicking on the appropriate item after hitting F12. Overall, it is much more secure than IE ever was. Because of Microsoft's influence in the market, some sites that are non-compliant with the standards may not display properly.

I also use Pegasus Mail for my email and Gravity for my newsreader. These three programs have no exploits, at least none I have seen nor read about. Pegasus Mail will not even go to a web site to download a web bug or graphic, so that eliminates one tracking method as well as a confirmation that the email address is a valid one. BTW, I am also behind a NAT router, which offers a slight improvement in security as well.

John Gray

If you don't have a reason, at least have an excuse.  
Just in case there's any doubt, my email address is useless. Please  
reply to this newsgroup.
