

Help with connect control and server load balancing

I'm trying to use the connect control module within FW1 to do server load balancing to two web servers. I followed the configuration guides/.PDF's but have had no success.

It seems that the problem is that the firewall just isn't answering for the Logical server address.

I've performed the following configuration:

1. Defined a network group object [HTTP_SERVERS] containing all the internal IP's of the real web servers and defined their external NAT properties.
2. Defined a network group object [WEB_FARM] containing all the external IP's as defined above.
3. Defined a logical server object [LOAD_BALANCER] defining the external IP address to be used for load balancing facing the public Internet. I defined the group to be redirected to [WEB_FARM]
4. I added two rules, one for permitting ANY to [LOAD_BALANCER] service HTTP action ACCEPT. The second rule for permitting the redirect of ANY to [WEB_FARM] service HTTP action ACCEPT.

I can reach any [WEB_FARM] address just fine if i go directly, but I cannot hit them from the [LOAD_BALANCER] address. It seems as though the FW1 is not listening for that IP address.

I defined a static arp for it using:

```
arp -s 65.106.231.3 00:04:5A:7E:0A:84 pub
```

What else do I need to do?
