>

GTF, OUT OF HERE! NO you didn't say this. Hell no you didn't say this!

No you're wrong you little stupid *bitch*. I got people working for me and working with me right now with MCP's MCSA's all that MC BS and lot of them don't know nor care like I didn't care about what an application proxy server is/was about. I know now what it is about since I now know what the security issues are by learning from this <g>. Some of the them have been in the field as long or longer as I have been in the field and don't give a damn about SECURITY I can go into Systems right now and talk to them about security and they know I know something about it, due to what I have learned in the <g>.

I had someone just the other day at work who knows nothing about the Raptor firewall deployed at work tell me I don't understand why I can do RDS with machines at work, but I cannot connect to my network at home. I had to tell him that the firewall was stopping him doing it. I am still trying to get the guy to install outbound protection on the machines on his home network. And this man teaches computer classes IL. University.

You little stupid fool. Security was not and is not my game. I think I told your dumbass this before. But I'll tell you right now I know more than you do and I'll tell it to your damn face.. I know more than you about how to secure a network.

Don't side step the issue. I got a wireless/wired router with wireless and wired machines talking to each other and . Linksys Tech support was no help period. I had to figure it out and no one in the router <g> could tell me either..

WTF, does a proxy server have to do with you jumping in with some BS from you about making wired and wired machines talk to each other with the Linksys router being on the LAN?

comp.security.firewalls: Re: Wireless Router behind SonicWall Pro Setup

You little *bitch* talking to me about some damn application proxy server.
GTF, out of here with this BS.

If, you want to comedown to it, WTF is a COM+ server and its purpose in OOPs programming? . WTF is the Citrix Terminal Server Farm and WEB based application programming? What makes the BlackIce IDS/firewall able to protect IIS, COM +, SQL Server on all my machines when I put one of the machines into the DMZ of the router, without a lot of that shit being security patched --- especially SQL Serve. You do know what DMZ on the router is for you little clown?.

What are the major differences between the Win 9's OS and the NT based OS?

You little fucking *bitch* you don't have a damn clue about anything do you?

You dumb bastard you had better come up with something better than this.

GTF out of here with this BS!

The question is what do you know about a damn router wired or wireless period..

Lets hear it damn it!

Shit --- you little fucking bastard LOL LOL LOL LOL!

Dr. *D* :).
