No, this is not a problem. Controlling already running programs what they're sending out is a broken concept anyway.

> Since XP Home doesn't really have good security like XP Pro

In what way?

> A real firewall would pop up a warning that "program xxxxx is trying to
> connect to the Internet."

Only a "Personal Firewall" with the design flaw to make the person responsible for security decisions of all the people, who should be protected and NOT protect, the user, asks in such a absurd way.

A sensible implementation of a security system for home users offers protection for them without making those people responsible for security related decisions, who don't have a clue of what's going on.

> The advice about being behind a router is a great help and I do it as well.

If the "router" is running a packet filter and maybe NAT, then this is a good idea, if the packet filter is well configured by default.

> But if malware gets installed on your computer, the NAT router is also going
> to let it happily send your passwords away without warning you as well.

Yes. And this is a very good idea, because filtering the PINs and passwords directly leads into attacks to find them out. It's just misunderstanding data security to filter away to hide something.

An example; say, I have a two digit PIN. And I'm filtering it away to hide it. Well, which one was it?

00 01 02 03 04 05 06 07 08 09
10 11 12 13 14 15 16 17 18 19

Re: Do I really need a FW besides WXP

20 21 22 23 24 25 26 27 28 29
30 31 32 33 34 35 36 37 38 39
40 41 43 44 45 46 47 48 49
50 51 52 53 54 55 56 57 58 59
60 61 62 63 64 65 66 67 68 69
70 71 72 73 74 75 76 77 78 79
80 81 82 83 84 85 86 87 88 89
90 91 92 93 94 95 96 97 98 99

Complete this yourself for usual PINs with 4 or 5 digits and a small computer program, which does the job of counting. Then you'll have your homework ;-)

Anybody, who offers filtering data away as a solution to hide this data, has no clue of data security at all.

Yours,
VB.
