The sonic wall firewall allows you to configure the sonicwall global vpn client from the actual firewall

ok, but I made the experience sonicwall is crap.

split tunnels is therefore setup on the sonicwall firewall and this automatically pushes to the client

Usually if the tunnel is established you get an valid spd entry and only those packets will be send encrypted (depends on your config)

the dns entries when connected are the same as our lan dns entries and these are working
on the lan side the gateway is the main work gateway to the internet and works from office lan but not the vpn client
dns resolves but when attempting to go out on to the internet then a tracertout our ping will time out

Sounds like your packet goes through the tunnel, check your phase2 policy..

cheers

SOLVED

Right to solve this then you will need to addin an additional NAT translation – This then magically makes it all work

Re: Sonicwall PRO 3060 VPN not Connecting to internet

Configure NAT Policy

(Only Needed for WAN GroupVPN)

" Select NAT Policies

" Enter Original Source: In this example, Any

" Enter Translated Source: In this example, WAN Primary IP

" Enter Original Destination: In this example, Any

" Enter Translated Destination: In this example, Original

" Enter Original Service: In this example, Any

" Enter Translated Service: In this example, Original

" Enter Inbound Interface: In this example, X1 (note this is your WAN Interface)

" Enter Outbound Interface: In this example X1 14

The Sonic wall documentation is available from here
