I have 15+ years of development and networking experience and about two years of security, primarily policy development and firewall admin. I want to persue security, particularly on the policy side. Right now I am "between jobs". Given this market it may take some time to find a job so I am considering getting some training and certification. Looking at posted openings I see that logs of positions ask for both Cisco experience and security. Would it make sense to get some Cisco training or should I just concentrate on the security end? Any thoughts out there? My instinct is to broaden my training since smaller companies want people with multiple skills, but I am not sure about the value of going after a "low" level technical skill at this time.
