Hi Security folks,

Hope you don't mind me drawing on your vast knowledge again. You've never failed me yet! At work we are going to set up a physically seperate network (from our main LAN) for web browsing.

I would like to use severely minimized systems for this – no unnecessary applications or functionality. Anyone know of a good resource covering such an approach, or have any advice ? I'm not much of a Linux user yet, although I'm trying to find time to be! but I was thinking Linux might be a good bet.

Any advice gratefully recieved...

TIA

Craig.
